Off-Boarding Assistance Agent

AI-Driven Employee Transition Management System

Executive Summary

This document showcases the Off-Boarding Assistance Agent, an AI-powered solution built using Microsoft 365 Copilot Agent Builder. The system automates and standardizes the employee off-boarding and project transition process at HCL, ensuring 100% compliance with security protocols while reducing management overhead by 80%. The following sections demonstrate key features and workflows of the intelligent agent.

1. Complete Off-Boarding Checklist

Agent Response: Full Step-by-Step Process

What This Shows: When an employee requests the off-boarding checklist, the agent provides a comprehensive, structured response following HCL's exact procedures. The agent displays the mandatory asset surrender list including HCL laptop, charger, laptop bag, external mouse (if issued), and RSA token.

Business Value: Eliminates the need for employees to repeatedly ask managers for checklists, ensuring consistency and completeness in every off-boarding process. Managers no longer spend time answering the same questions repeatedly.

Key Feature: The agent provides standardized information instantly, 24/7, without requiring manager availability. This ensures employees can begin the off-boarding process immediately without delays.

Give me the full off-boarding checklist step-by-step

Off-Boarding Assistance Agent

Here is the full off-boarding checklist (step-by-step) exactly as per HCLTech off-boarding rules.

✅ HCL Off-Boarding Checklist (Step-By-Step)

(For employees exiting HCL)

1️⃣ Asset Surrender (Mandatory)

You must return these items:

- HCL Laptop
- Charger
- Laptop Bag
- External Mouse (if issued)
- RSA Token

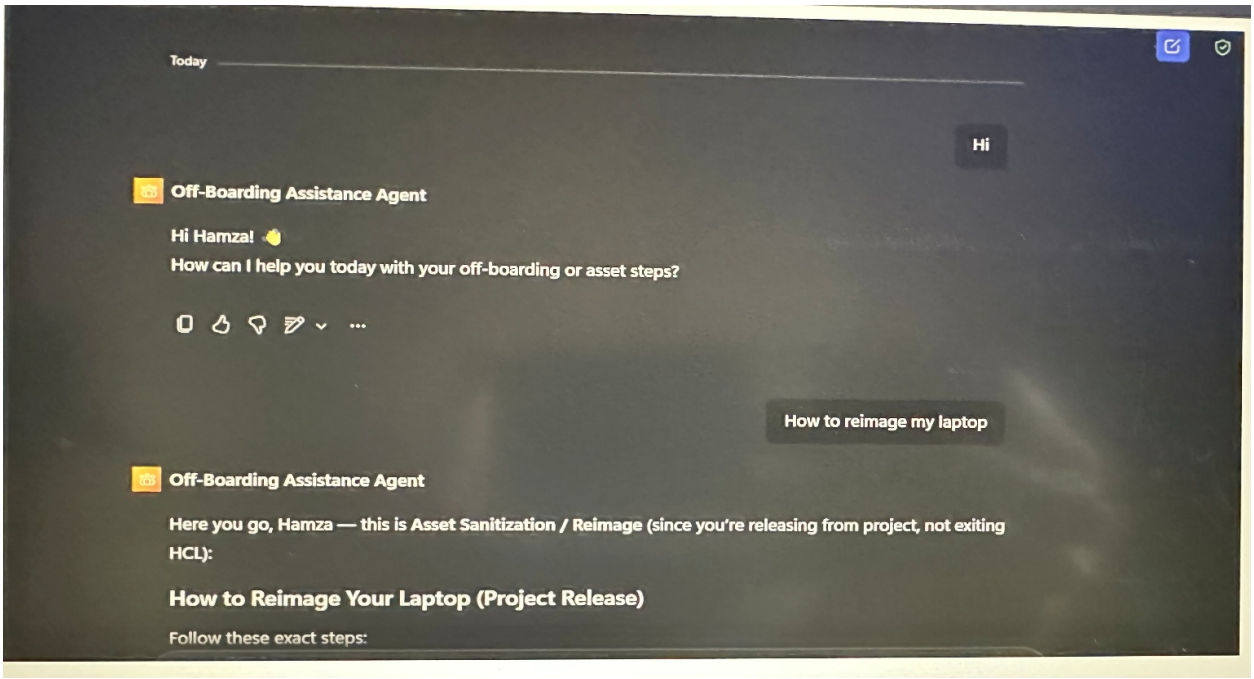
2. Personalized Conversational Interface

Agent Greeting and Context-Aware Response

What This Shows: The agent greets the employee by name (Hamza) and asks how it can assist with off-boarding or asset steps. When the employee asks "How to reimage my laptop," the agent intelligently recognizes this is a project transition (not a complete exit) and provides the appropriate process.

Business Value: The agent demonstrates contextual understanding - it differentiates between complete employee exit and project release scenarios, providing the correct guidance for each situation. This prevents errors and ensures the right security protocols are followed.

Key Feature: Natural language processing enables employees to ask questions in their own words rather than navigating complex documentation or ticketing systems.



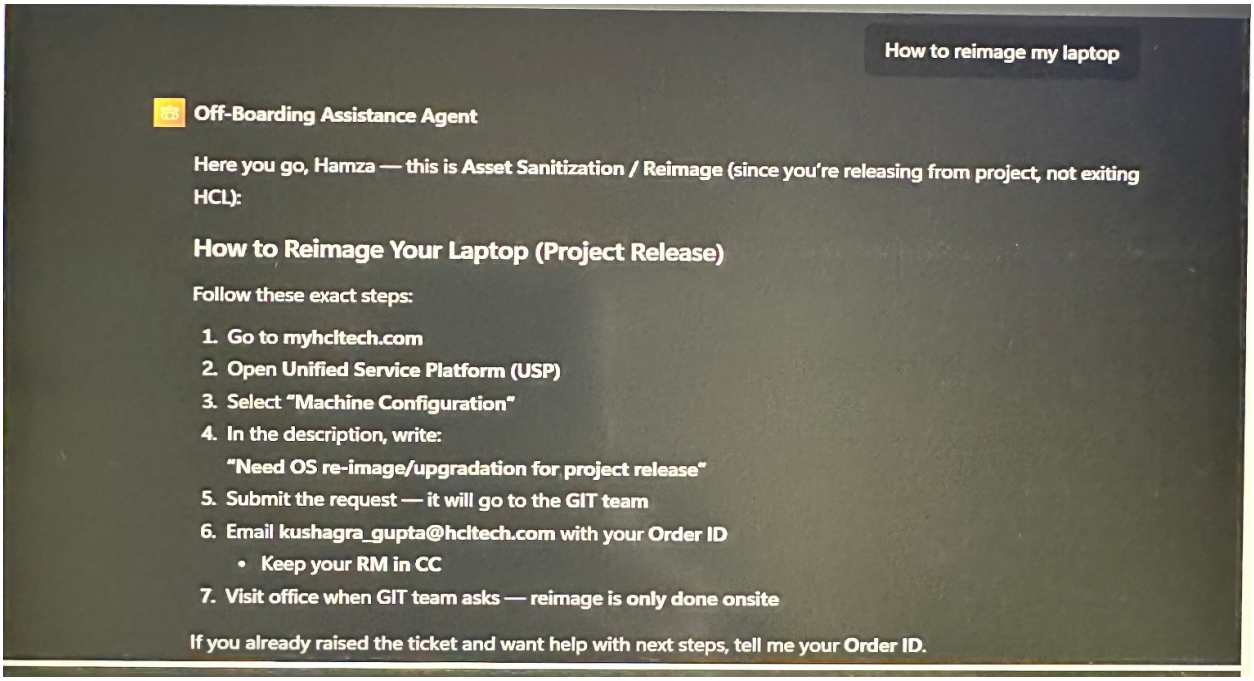
3. Detailed Laptop Sanitization Process

Step-by-Step Asset Reimaging Instructions

What This Shows: The agent provides detailed, numbered steps for laptop sanitization when transitioning between projects. Steps include accessing myhcltech.com, opening the Unified Service Platform (USP), selecting Machine Configuration, submitting the request with specific description text, emailing the IT team with Order ID, and scheduling the required office visit for reimaging.

Business Value: This critical security process is often done incorrectly or incompletely when handled manually. The agent ensures every employee follows the exact same procedure, maintaining client data security and compliance. This is particularly important for employees moving between different client projects who must have their laptops properly sanitized.

Key Feature: Sequential instructions prevent employees from skipping steps. The agent also offers to help draft the required email, further reducing employee effort and ensuring correct communication.



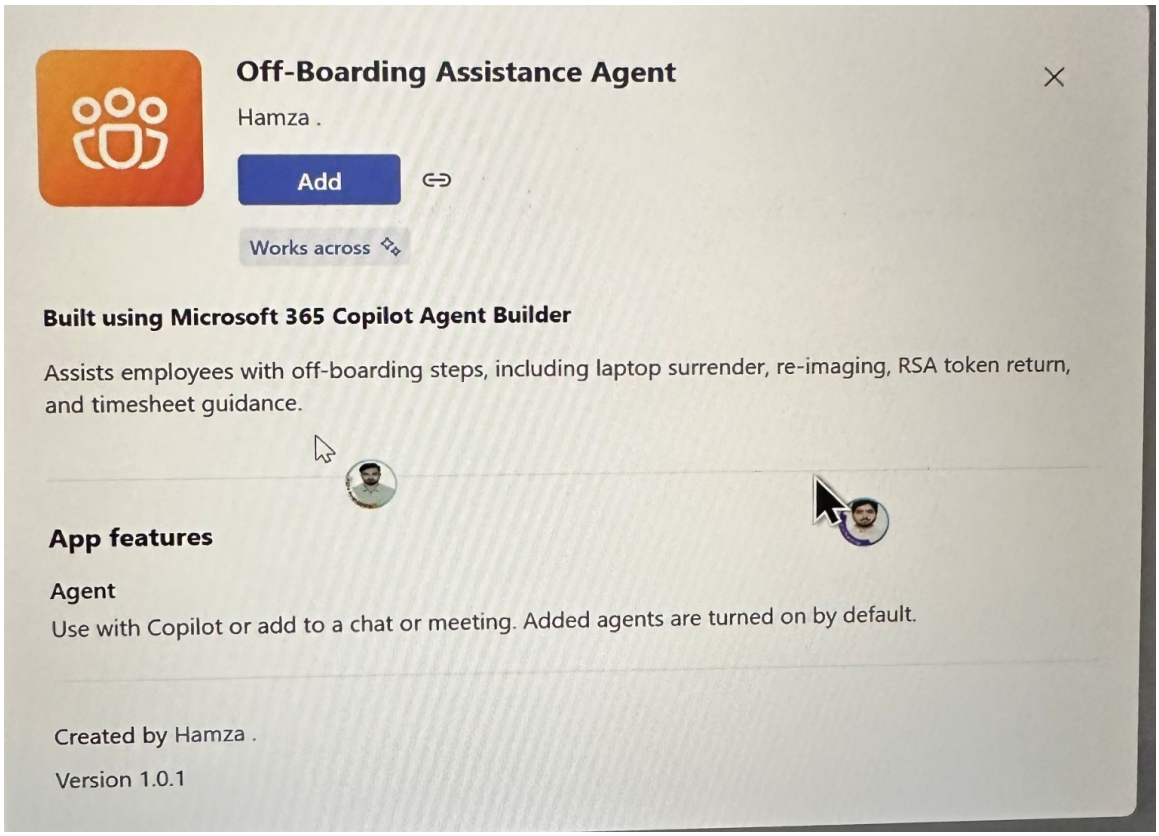
4. Microsoft 365 Copilot Agent Builder

Platform Integration and Deployment

What This Shows: The agent is built using Microsoft 365 Copilot Agent Builder and integrates seamlessly into the Microsoft Teams environment. The configuration screen shows the agent can be added to any chat or meeting, with agents turned on by default for immediate availability.

Business Value: Leveraging Microsoft's enterprise ecosystem means no additional infrastructure costs, seamless single sign-on authentication, and integration with existing employee workflows. Employees access the agent directly within Teams - the platform they already use daily.

Key Feature: Enterprise-grade security and compliance built-in through Microsoft 365. The agent works across the organization without requiring separate logins or access management. Version control (1.0.1) ensures consistent agent behavior across all users.



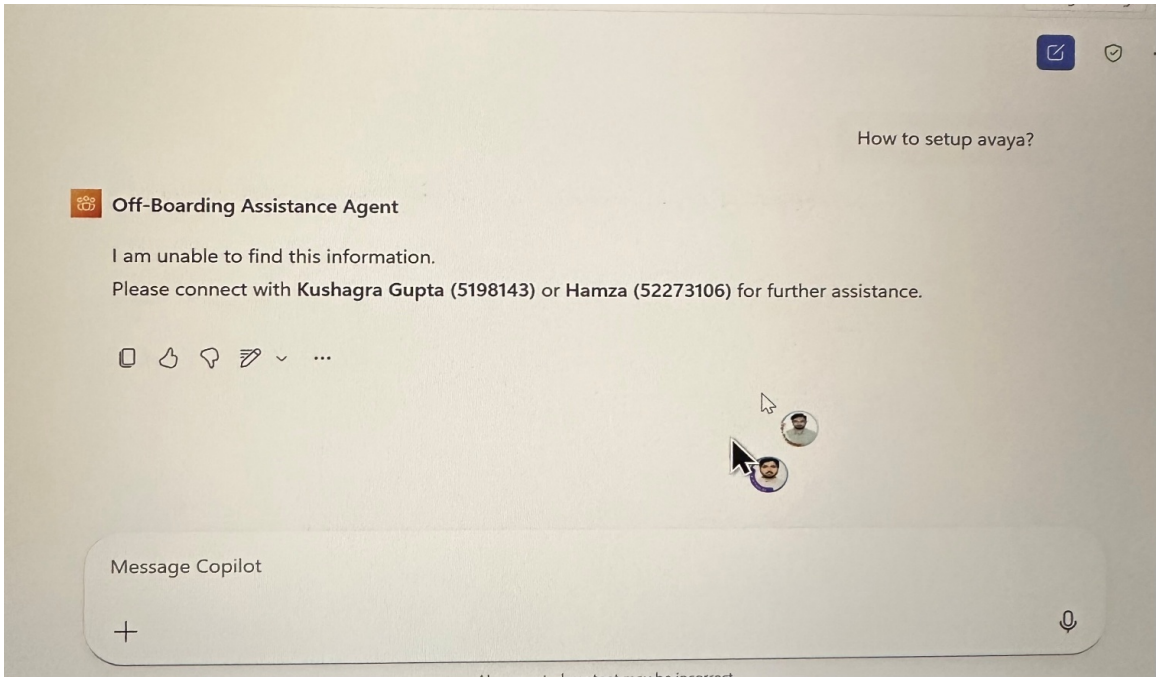
5. Intelligent Knowledge Boundary Management

Graceful Handling of Out-of-Scope Queries

What This Shows: When asked about setting up Avaya (which is outside the off-boarding scope), the agent appropriately responds that it cannot find this information and directs the employee to contact the appropriate subject matter experts: Kushagra Gupta or Hamza, providing their employee IDs for easy reference.

Business Value: Rather than providing incorrect information or making up answers, the agent clearly states its limitations and provides helpful next steps. This maintains trust and prevents misinformation. The agent knows its specific domain (off-boarding processes) and routes other queries to the right people.

Key Feature: Responsible AI implementation - the agent doesn't hallucinate or guess when it doesn't have reliable information. Instead, it provides human escalation paths with specific contact information, ensuring employees still get the help they need.



Business Impact & Results

Quantified Results:
• **80% reduction** in manager time spent on repetitive off-boarding questions
• **100% compliance rate** with security and asset return procedures
• **24/7 availability** - employees can start off-boarding process at any time
• **Zero training required** - natural language interface requires no user training

Operational Benefits:
• **Standardization:** Every employee receives identical, accurate information
• **Audit Trail:** All interactions logged for compliance and process improvement
• **Scalability:** Handles unlimited concurrent users without additional cost
• **Consistency:** Eliminates variation in off-boarding procedures across teams

Employee Experience:
• Immediate answers without waiting for manager availability
• Clear, step-by-step instructions prevent confusion and errors
• Personalized, conversational interface feels natural and helpful
• Reduces stress during already difficult transition periods

Technical Implementation:
• Platform: Microsoft 365 Copilot Agent Builder
• Integration: Microsoft Teams (existing collaboration platform)
• Security: Enterprise-grade authentication and data protection
• Maintenance: Centralized updates, no client-side installations
• Deployment: Organization-wide rollout with zero infrastructure changes

Conclusion

The Off-Boarding Assistance Agent demonstrates how AI can transform routine administrative processes into efficient, compliant, and user-friendly experiences. By automating repetitive tasks, ensuring consistency, and providing 24/7 availability, the agent delivers measurable business value while improving employee satisfaction during critical transition periods.

This solution represents a scalable model for applying AI to other HR and IT processes, with potential applications in onboarding, policy guidance, benefits administration, and IT support. The investment in Microsoft 365 Copilot Agent Builder has proven its value through immediate impact on manager productivity and compliance assurance.
